

(a) Informed exploration

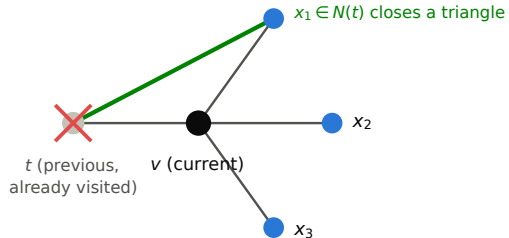

— SP: geodesic to the destination
 - - CR: smallest angle to the destination

(b) Walk-based exploration

self-avoiding, $h \sim U\{2, \dots, \text{diam}(G_t)\}$ hops ($h = 7$ shown)

— RW: uniform
 - - RWD: towards high degree
 RWI: away from high degree

(c) Next-hop weights $w(x)$, unvisited neighbours of v 

strategy	x_1	x_2	x_3
RW	1	1	1
RWD	k_{x_1}	k_{x_2}	k_{x_3}
RWI	$1/k_{x_1}$	$1/k_{x_2}$	$1/k_{x_3}$
RWL(q)	1	$1/q$	$1/q$

A move back to t is never available, so a return weight (node2vec's $1/p$) has no effect.
